

## International week of Vision numeric Technical Support July 2007

---

Once a year, **Vision numeric** gathers all engineers in application coming from all our subsidiaries. Together, they have a week to discover all the new products' versions, exchange their experiences and tips, question and answer one another and submit their ideas. This week is also the opportunity to present the latest developments Vision numeric undertakes and to look further into the most complex functionalities between experts.

---

During the week, each engineer presented the functionalities he manages the most out of the new ones.

Here, Jean-Claude France presents **TypeEdit**: the new **complex CAM parameters, expert configurations, new script possibilities** for creation and the complex non-generic post processors.

Every presentation was followed by questions and answers and exchanges between engineers.

The support team benefited entirely from the demos of our **3DESIGN Expert**: David Lehmann. He explained complex and expert functionalities of the **latest version of 3DESIGN**.

Finally, Patrick Pecontal, technical support director, **launched the latest version of LaserType: V4**. All engineers could discover the new **LaserType**, the **most modern safety measures**, the dongles and licence server.

Sessions planned throughout this week are a unique opportunity for our engineers **to deepen and to improve their products' knowledge**. Those moments are the occasion to analyze the experiences, feedbacks and methods of each one and they benefit the entire team for their technical know-how. **All of them end the week more qualified, professional and motivated to help out our customers.**

Those 5-day seminars are always very rich events in terms of professional and human exchanges. They are basis of **Vision numeric** success. See you all next year!
